

Fork Positioner for Forklifts

Forklift Fork Positioner - The fork positioner is actually a hydraulic device that can allow the driver to be able to maneuver the forklift without leaving the seat. They are constructed out of top quality materials and are meant to be able to withstand the most challenging operations and work environments. Side shifting units have the added ability to laterally position the arms or the entire load so as to facilitate much more exact lifting and position in a quicker and more efficient method.

The only one of its kind blade pocket design could enable operators to be able to securely swing the unit's blades without any fear of destroying the positioning cylinders. This allows the operator the choice to either perform independent or simultaneous fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be transformed into fork positioners on existing units.
